Vcloud director installation and configuration guide

VMware vcloud director installation and configuration guide.

22. Enter in all your information, Organization, State, Country, etc You certificates file will be located at this path `/opt/vmware/vcloud-director/jre/bin/keytool/certificates.ks`. Generating a CSR and submitting the request to a Certificate Authority # `cd /opt/vmware/vcloud-director/jre/bin /keytool -keystore certificates.ks -storetype JCEKS -storepass storecertpass -genkey -keyalg RSA -keysize 2048 -alias http` (replace storecertpass with a password you wish to use). Next step is to download the Windows Certificate Authority root certificate. Select Create and submit a request to this CA 12. We will now generate the CSR file for both http and consoleproxy # `/keytool -keystore /opt/vmware/vcloud-director/jre/bin/certificates.ks -storetype JCEKS -storepass storecertpass -certreq -alias consoleproxy -file consoleproxy.csr -keysize 2048 -validity 1095` (Feel free to change the validity, which is in days, also be sure to use the storepass you selected in step 6) # `/keytool -keystore /opt/vmware/vcloud-director/jre/bin/certificates.ks -storetype JCEKS -storepass storecertpass -certreq -alias consoleproxy -file consoleproxy.csr -keysize 2048 -validity 1095` (Feel free to change the validity, which is in days, also be sure to use the storepass you selected in step 6) 8. By default the iptables firewall is turned on, for my lab I will be turning it off by typing # `service iptables stop`, however if you wish to allow port 80 and port 443 you can simply type: # `iptables -A INPUT -p tcp -m tcp -s cAAA -dport 80 -j ACCEPT` (Allows port 80) # `iptables -A INPUT -p tcp -m tcp -s cAAA -dport 443 -j ACCEPT` (Allows port 443) # `iptables-save` (Saves the configuration) # `service iptables restart` (Restarts the service) 1c AAAAll go back to my WinSCP program and use it to upload the http.cer and consoleproxy.cer file to my vCloud Director server. Self Signed # `/opt/vmware/vcloud-director/jre/bin/keytool -keystore certificates.ks -storetype JCEKS -storepass -GENKEY -KEYALG RSA - HTTP HTTP` (replace password for the password you want to use). It is necessary to install the following add-ons: I have included this line for it to copy it and paste so that it does not a C you need to write all the a " : # `Yum Install Also-Lib Bash Chkconfig Coreutils Findutils Glibc Grep InitScripts KRBS5-Libs LibGCC LibICE LibSM LibStDC LibBCC libxau libxdmcp libxext libxi libxt module-init-tools net-tools pciutils procs redhat-lsb so after all these modules are installed, you can run # YUM Update to install the latest operating system updates when setting multiple VCloud Director Cells, let's go A need to configure a VCloud SCORSE SERVER storage NFS volume. We will change the A / OPT / VMware / VCloud-Director / Data / Transfer directory (this is going to be the mounting point for our NFS storage) # CD / OPT / VMware / VCloud-Director / Data / Transfer My assembly point for The volume NFS of transfer storage is / volume1 / vcloud6-transfer-storage. VCloud Director is based on SSL certificates. As you can see in the screenshot below, I downloaded the certificate for http.cer, then I went and repeated this process to download the ConsoleProxy.cer 16 file. Move the cursor to the last line and write: 192.168.2.170. / Volume1 / VCloud6-Transfer-Storage / Opt / VMware / VCloud-Director / Data / Transfer NFS RW 0 0 Press the ESC key to exit the insert mode. Inside VI press I that places you in the insertion mode. I refer to these two windows as SSH window 1 and SSH window 2. Now jumping to SSH window 2. Select your HTTP and Console Proxy IP address. In my home laboratory I use a Synology NAS that includes NFS, however if I do not have a NAS within your laboratory, you can use something as brakes for NFS storage. After all these steps, we now install the HTTP and CONSOLEPROXY certificates: # /keytool -storetype JCEKS -storepass storecertpass -keystore certificates.ks -importcert -alias http -file http.cer (replace the storepass with your password) 18. Copy everything in this file, including the A c A BEGIN NEW CERTIFICATE REQUEST A e and A e A END NEW CERTIFICATE REQUEST A e 13. Copy the contents into the Saved Requests: and in Certificate Template select Web Server. Also write A # /opt/vmware/vcloud-director/data/transfer Then n, go ahead and change the permissions for /opt/vmware/vcloud-director/data/transfer directory following this Article 5. One is running the installation and the second will be doing side steps. Within my Synology I have created a volume called vcloud6-transfer-storage and have allowed full NFS access for IP address 192.168.2.170 (the NFS storage IP of vCloud Director). In this lab, we will focus on creating a CSR, submitting the request to a CA, and installing the certificate. I added the following host entries to the Active Directory DNS server: 192.168.1.170 A vcloud6director1.vmlab.local (feeder log and PTR) 192.168.1.171 A vcloud6director1proxy.vmlab.local (feeder log and PTR) Before we begin the next steps, we will work with 2 SSH windows connected to the le le enitnoc euq 2102 reverS swodniW IM 7 n Aicamrofi al adot eniler. rotcerID duolCV The authority server is called VMAD1. If you want to exit without saving changes, you can type: q! 4. Click Send 14. Let's jump to SSH window 2. To do this, I go to my Windows server, " Certification Authority Open " Expand the Certification Authority " local ", right-click on your server, in My case it shows as VMLAB-VMAD1-CA, and select PROPERTIES. In the General tab, click View Certificate: Click on the tab Details: Click Copy to File: Use the wizard to export The file as der a " Select a location " http.cer and consoleproxy.cer. /opt/vmware/vcloud-director/jre/bin Once the file is uploaded we will return to SSH window 2 and install the raZ certificate by typing: # /keytool -alias http -storetype JCEKS -storepass storecertpass -keystore certificates.ks -importcert -file http.cer (replace the storepass with your password) 19. To mount this type of server: # Mount -t NFS 192.168.2.5: / volume1 / vCloud6-Transfer-Storage vCloud6-Transfer-Storage I want this mount point to be available every time the server is restarted, to do this, we must modify the file / etc / fstab # vi / etc / fstab 3. Fill in all the information " n. If you are not planning to configure multiple VCloud Director cells, you can skip this step as the server will use the local IT disk for transfer server storage. storage.`
